

SUBJECTIVE QUESTIONS

1. Which are the top three variables in your model which contribute most towards the probability of a lead getting converted?

The top three variables in my model that contribute most towards lead conversion are –

- 1) What is your current occupation
- 2) Last Activity
- 3) Total Time Spent on Website

Apart from these, there is one more important variable – Lead Source.

2. What are the top 3 categorical/dummy variables in the model which should be focused the most on to increase the probability of lead conversion?

The top three dummy variables that contribute most towards lead conversion are –

- 1) Lead Source_Welingak Website
- 2) What is your current occupation_Working Professional
- 3) Last Activity_SMS Sent

Another important dummy variable is – Lead Origin_Lead Add Form.

3. X Education has a period of 2 months every year during which they hire some interns. The sales team has around 10 interns allotted to them. So, during this phase, they wish to make the lead conversion more aggressive. So, they want almost all the potential leads (i.e., the customers who have been predicted as 1 by the model) to be converted and hence, want to make phone calls to as much of such people as possible. Suggest a good strategy they should employ at this stage.

To acquire maximum number of conversions within a short period of time, the Sales interns should focus solely on pursuing existing **hot leads** i.e., those leads who –

- Spend high time on the company's website looking for courses
- Got to know about X Education through 'Welingak Website'
- Are working professionals
- Have last sent an SMS or have chatted via Olark.

The same order as mentioned above can be used by the Sales team interns for contacting the leads, as the conversion rates for such types of leads is the highest.

4. Similarly, at times, the company reaches its target for a quarter before the deadline. During this time, the company wants the sales team to focus on some new work as well. So, during this time, the company's aim is to not make phone calls unless it's extremely necessary, i.e., they want to minimize the rate of useless phone calls. Suggest a strategy they should employ at this stage.

In this case, the Sales team can contact leads through SMS or email, instead of through phone calls. This is one way to reduce useless phone calls.

Another way is to strictly pursue hot leads only, and not every lead. They should particularly contact those leads who tick more than one checkbox among the ones mentioned above (i.e., those who have multiple positive responses across categorical variables). This method would also reduce unnecessary phone calls significantly.
